TALKING WITH YOUR PATIENTS ABOUT
SEXUAL DYSFUNCTION IN MS

Meghan Beier, PhD

National Multiple Sclerosis Society
The National MS Society’s Professional Resource Center provides:

- Easy access to comprehensive information about MS management in a variety of formats;
- Dynamic, engaging tools and resources for clinicians and their patients;
- Clinical information to support high quality care; and
- Literature search services to support high quality clinical care.

# Introduction

Use this resource to facilitate conversations with your patients about MS-related sexual changes and recommended treatment strategies. Sexuality is difficult for most people to discuss—even with their physicians. In addition, many people with MS are unaware that sexual dysfunction can be related to the disease. The following are strategies for addressing this sensitive topic in ways that will reduce embarrassment and foster comfort and communication between you and your patients, and between your patients and their partners.

How and when should I address the topic of sexual problems in MS?

- Since changes in sexual function and/or responsiveness are common in MS and can occur even as an early symptom of the disease, it is important to raise this issue beginning at the time of diagnosis. You are encouraged to include sexual problems in your initial discussion of possible MS symptoms, and revisit this subject as often as necessary.
- By talking openly about possible sexual changes, you are alerting your patients to potential problems and simultaneously giving them the message that you are comfortable discussing the topic and prepared to provide treatment or an appropriate referral if the need arises.
- Questions about sexual function should be included in your initial evaluation and during subsequent office visits, particularly if there has been significant disease activity, a change in bowel and/or bladder function, or a change in the medications you are prescribing. If you conduct a review of systems during your initial and/or follow-up evaluations, asking about sexual function when you are inquiring about urological or gynecological function provides a context that facilitates discussion. If you use a patient self-report for this purpose, include a question on sexual function.
- Patients and their partners benefit from this information because it helps forestall miscommunication, misunderstanding, and hurt feelings in the event these changes occur. Open discussion also provides people with a vocabulary for talking about this difficult topic.
- It is important to address the topic of sexual function even with patients who are single or have no apparent partner. Single people and gay, lesbian or transgender patients who do not bring their partners with them to the doctor’s office, may find it particularly difficult to raise the topic of sexual changes. They also resent any assumption on the part of their healthcare providers that they have no sexual interest or concerns.

How can I convey this information in a way that protects my patients’ self-esteem and avoids feelings of embarrassment and inadequacy?

- People are less likely to feel embarrassed or inadequate when they have a clearer understanding of the changes they are experiencing.
- People with MS are reassured to know that changes in libido or ability to achieve orgasm, for example, may be caused by neurologic changes or medication. This helps them externalize the problem—i.e., blame MS rather than themselves—and maintain
Well partners are reassured to know that the changes in libido or sexual responsiveness are not a reflection of their partner’s decreased attraction to them or loss of affection for them.

Your ability to talk comfortably about sexual issues and listen/respond to your patients’ questions and concerns helps protect their self-esteem and reduce their discomfort.

Talking openly about MS-related sexual changes conveys the clear message that they are neither unique in having these problems nor alone in their efforts to deal with them.

Some people may appreciate your concern for their sexual well-being, but still prefer to learn the details of MS-related sexual dysfunction from written materials. The National MS Society (1-800-344-4867) can provide you with written materials to keep on hand in your office.

What are the most important points for me to discuss with my patient?

- Recent prevalence studies indicate that up to 90% of men and 89% of women with MS experience changes in sexual function.
- The prevalence of sexual dysfunction is higher in MS than in other chronic diseases, and almost five times higher than in the general population.
- Sexual problems in MS can be divided into primary, secondary, and tertiary types:
  - **Primary sexual dysfunction** occurs because of demyelinating lesions in the spinal cord and brain that directly impair sexual feelings and/or response.
    Examples include:
    - Decreased or absent libido
    - Altered genital sensations or
    - Paresthesias
    - Decreased or absent genital sensations
    - Decreased frequency or intensity of orgasms
    - Erectile dysfunction
    - Decreased vaginal lubrication or clitoral engorgement
    - Decreased vaginal muscle tone
  - **Secondary sexual dysfunction** refers to changes in sexual function that result indirectly from other MS symptoms or medical/pharmacological interventions. The following MS symptoms can interfere with sexual expression:
    - Fatigue interferes with interest, activity level, and spontaneity.
    - Spasticity impacts comfort and positioning.
    - Non-genital sensory paresthesias reduce comfort and pleasure.
    - Weakness interferes with sexual activity.
    - Pain reduces sexual activity and pleasure.
    - Bladder/bowel dysfunction causes anxiety and discomfort.
    - Tremor interferes with sexual activity.
Cognitive impairment impacts attention and psychogenic stimulation. The following medications can interfere with the sexual response:

- Psychotropic medications, including tricyclic antidepressants and selective serotonin reuptake inhibitors for depression, monoamine oxidase inhibitors (MAOIs), anti-psychotic medications, anti-mania medications, benzodiazepines, can inhibit libido and orgasm.
- Anticholinergic and antimuscarinic medications reduce vaginal lubrication.
- Antispasticity medications produce significant fatigue.
- Anti-seizure medications used to control pain or tremor produce significant fatigue.

- **Tertiary sexual dysfunction** refers to the psychological, social, and cultural issues that interfere with sexual feelings and/or response. Examples include:
  - “Disabled people aren’t sexually attractive.”
  - “I can’t be both a caregiver and a lover.”
  - “If I don’t like myself any more, how can I expect someone else to find me attractive?”
  - “This isn’t the same person I married.”
  - “He/she doesn’t find me attractive now that I’m a burden.”
  - “With everything else that’s going on, sex is the last thing I care about right now.”

- With the exception of certain types of erectile dysfunction, MS-related sexual changes do not impact fertility. Men and women with MS need to make the same kinds of family planning/contraceptive decisions as any other couple.

**Once we have discussed these MS-related sexual problems, how can I engage my patient in the necessary problem-solving behaviors and promote confidence and hope?**

- It is important to emphasize that a variety of treatments/management strategies are available to address primary, secondary, and tertiary sexual dysfunction.
  - A thorough assessment of sexual function typically includes:
    - Multi-disciplinary assessment of primary, secondary, tertiary factors
    - Sexual history, psychosocial and family history, couple’s interview
    - Self-report instruments
    - Review of medical history
    - Evaluation of current medication regimen
    - Specialized medical tests (e.g., penile Doppler sonography, nocturnal penile tumescence, injection of prostaglandin into corpus cavernosum)
  - The rehabilitation of sexual function includes:
- Education and support to promote active problem-solving
- Medical symptom management, including adjustment of medications
- Communication skills training—between partners and between patient and medical team
- Counseling targeting intimacy and sexuality

○ Management of **primary sexual dysfunction** in men includes:
  - Oral medications such as sildenafil citrate (Viagra), vardenafil (Levitra), tadalafil (Cialis)
  - Intracavernous injection therapy (alprostadil (Prostin VR), papaverine)
  - Intraurethral suppositories (alprostadil (MUSE))
  - Topical medication (Alprox-TD (Topiglan))
  - Vacuum erection device
  - Penile prostheses
  - Body Mapping Assessment/Exercise may enhance arousal by enabling the man with MS to identify parts of his body and types of touch that feel good/stimulating, and then communication this information to his partner (see chapters on sexuality in the recommended readings).
  - Sexual aids such as vibrators or other devices

○ Management of **primary sexual dysfunction** in women includes:
  - Medications such as phenytoin (Dilantin), carbamazepine (Tegretol), gabapentin (Neurontin), and duloxetine hydrochloride (Cymbalta) may relieve painful paresthesia
  - Vibrators and other sexual aids may provide added or more focused stimulation
  - Water-soluble lubricants (e.g., K-Y Jelly, Astroglide, Replens) enhance comfort
  - Pelvic floor exercises (e.g., Kegel) may enhance orgasmic response.
  - Body Mapping Assessment/Exercise may enhance arousal by enabling the woman with MS to identify parts of her body and types of touch that feel good/stimulating, and then communication this information to her partner
  - Counseling interventions to enhance intimacy and communication

○ Management of **secondary sexual dysfunction** in men and women requires careful monitoring of other MS symptoms and their management.

  ▪ Coping with bladder dysfunction involves:
    - Tailoring symptomatic treatments (medications and intermittent
catheterization) around times of anticipated sexual activities

- Managing urinary leakage by avoiding fluid intake for a few hours prior to intercourse; males can use condoms for small amounts of leakage
- Managing catheters involves:
  - Men: Folding the indwelling catheter over the penis and placing a condom over the penis and catheter
  - Women: Taping the drainage tube to the abdomen to prevent excess pulling or pressure
  - Utilizing varied sexual positions to minimize catheter pulling or pressure
  - Using a longer drainage tube and placing the bag out of the way
  - As permitted by the physician – temporarily disconnecting the bag and clamping the catheter

- Managing impairments of attention/concentration
  - Creating a romantic/sexually-stimulating environment with minimal distractions
  - Creating rituals for regaining attention when distraction occurs
  - Learning to alter the pace of sexual touching and communication when distraction occurs

- Managing SSRI-related sexual dysfunction:
  - Some patients can tolerate SSRI holidays one day a week, which may reduce the sexual dysfunction for that day
  - Adding a low dose of the antidepressant medication bupropion (Wellbutrin) to the SSRI regimen sometimes helps counteract the sexual side effects
  - Adding a phosphodiesterase-5 inhibitor for men

- A variety of management strategies are available to address tertiary sexual dysfunction in men and women.
  - Counseling/education concerning ways to talk comfortably about sexual feelings, concerns, and behaviors
  - Counseling focusing on attitudes that interfere with sexual enjoyment (e.g., goal-oriented sex in which orgasm is considered the only satisfactory “outcome”; role conflict; intimacy vs. sex; poor self-esteem and/or body image; negative reactions to physical disability)
  - Body Mapping Exercise for enhancement of body image
  - Couple’s education/counseling to enhance sensual, erotic, and “special person” aspects of their relationships
  - Stress-management training to manage anxiety
  - Couple’s counseling to enhance adaptation to MS, improve empathy and understanding, and improve communication
- Anger management training
  - Reassure your patients that you will help them with this problem and provide any necessary referrals. There may be medical providers in your area that specialize in sexual dysfunction, including: urologists, OB/GYNs, physical therapies with specialized knowledge of pelvic floor disorders, and mental health providers.

What is the best format for providing this information?

- People learn differently – even within a single couple. Face-to-face conversations, printed literature, and audio or video media are all acceptable ways to provide information about sexual dysfunction. Once the topic has been raised by you or your patient, you can offer alternative sources of information.
- Regardless of the format of the information provided, it is important to make yourself available for questions and reiteration of the information.
- The topic of sexuality cannot be addressed comfortably or thoroughly in a regular office visit. Once the subject has been raised you might want to schedule an additional visit to focus on sexual questions and concerns.

When and how should I involve a significant other in this discussion?

- With your patient’s consent, it is usually helpful to invite the spouse or partner to join in an early discussion MS and types of symptoms it can cause. This type of early education can prepare couples recognize some of the problems that might arise.
- If the person with MS develops sexual symptoms, it is important to encourage open communication with the partner, so the appropriate interventions can be initiated. You then have the opportunity to help the couple clarify the problem, avoid unnecessary misunderstand or blame, and set the stage for treatment interventions and effective problem-solving strategies.

What kinds of emotional responses can I expect from my patients and their significant others?

- Your ability to talk comfortably about sexual issues will reduce the embarrassment and awkwardness that so often surrounds this topic.
- Most people with MS will be relieved to know that there is a neurologic basis for the changes they are experiencing, as well as treatment strategies to address the problems.
- Spouses/partners are often relieved to know that the “fault” does not lie with them.
- While some patients will be reluctant to discuss sexual problems with you or another professional, a surprising number are eager for information, support and intervention.

What resources are available to support my patient?

- The National MS Society (1-800-344-4867; nationalMSsociety.org) offers:
  - Educational programs and support groups
  - Referrals to professionals in the community who provide specialty care
Print and web-based materials about sexuality, pregnancy, parenting and other topics available free of charge by calling an MS Navigator at 1-800-344-4867 or online at:

- nationalMSsociety.org/Intimacy
- nationalMSsociety.org/Pregnancy
- nationalMSsociety.org/Brochures
